TITLE: On the possibility of resonance passage of electrons in crystals through a system of barriers 21

SOURCE: Zhur. eksper. i teoret. fiz., v. 45, no. 2, 1963, 207-213

TOPIC TAGS: quantum-mechanical system, potential barrier, resonance tunnelling, Fermi surface, crystal, dielectric barrier

ABSTRACT: The transmission coefficient of a one-dimensional quantum-mechanical system consisting of two potential barriers is considered to determine whether a continuous transition can be produced between different resonance effects by merely deforming the potential barriers without destroying the resonance that occurs when the energy of the incident particles coincides with that of the quasi-level in the well between the barriers. It is shown that in principle resonant tunnelling of electrons is possible in a semiconductor through two closely located dielectric layers that act as potential barriers of different heights. An external electric field can make the barriers equal and control the resonance current. The condi-

Card 1/2

L 16889-63

ACCESSION No: AP3005270

tions necessary for experimental realization of this effect are discussed. It is indicated that the magnitude of the resonance current depends on the shape of the Fermi surface of the main crystal. The reflection and transmission of the electrons through the dielectric barriers must be specular, and all mean free paths must be large compared with the thickness of the system. Scattering imposes a limit on the attainable resonance parameters in analogy with the behavior of light waves in the presence of two totally reflecting barriers. "I am grateful to L. V. Keldysh for pointing out an anomalous behavior of bismuth." Orig. art. has 2 figures and 7 formulas.

TITLE: Resonance tunneling of electrons in crystals

SOURCE: Zh. eksper. i teor. fiz., v. 47, no. 1, 1964, 270-277

TOPIC TAGS: electron tunneling, electron resonance tunneling, resonance tunnel current, potential barrier, potential well

ABSTRACT: The tunnel current has been calculated in a system of two or three closely spaced potential barriers produced by dielectric layers in a conductor. It was found that when there is no scattering, the resonance tunnel current is very strong in comparison to the non-resonance current. The dependence of current on electric potentials V_2 and V_4 , applied to barriers 2 and 4 respectively, has been investigated for a two barrier system. It shows that with the change of V_2 , the resonance tunnel current reaches a maximum followed by a negative slope. The effect of electron scattering is taken into account. Scattering decreases the resonance tunnel current through the barrier system due to the appearance of a resonance scattering

Card 1/2

ACCESSION NR: AP4042399

current. Resonance tunnel current may become saturated. The resonance transmittance is calculated for a three barrier system. It is found that the resonance tunnel current has a sharp maximum if the quasi-levels in the neighboring wells coincide. Orig. art. has: 21 formulas and 3 figures.

TOPIC TAGS: optic pumping, light pipe, laser optics, optic waveguide

ABSTRACT: This Author Certificate introduces an electromagnetic resonance capacitor with total internal reflection which uses resonance diffraction for pumping waves into a coaxial light guide. The capacitor is made in the form of a dielectric waveguide surrounded by a dielectric coaxial shell with a lower index of refraction and placed in a dielectric with a higher index of refraction for pumping the waves into the waveguide (see Fig. 1 of Enclosure). TITLE: ^{21,44,55} Total internal reflection filter. IV.

SOURCE: Optika i spektroskopiya, v. 19, no. 3, 1965, 403-408

TOPIC TAGS: optic filter, optic coating, light reflection, optic research

ABSTRACT: The first three parts of the article were published in Opt. i spektr. v. 12, 318, 1962; v. 13, 18, 1962; and v. 14, 67, 1963. In this paper the author considers the smoothness and parallelism requirements that must be satisfied by a total internal reflection filter, using for this purpose calculations that take account of various layer defects. It is shown that earlier calculations by others are valid only when the dimensions of the nonuniformities in the layer are large compared with the characteristic resonance diffraction length, but in practice this length is usually so large that the uniformities are small in comparison. It is shown furthermore that a total-reflection filter is very sensitive to regular wedge-type nonuniformities of the resonator but is less sensitive to irregular random steplike nonuniformities. Since regular nonuniformities can be avoided, an optical filter with very narrow transmission band and high resolution may become feasible. In particular, the wedge defect can be avoided by appropriate choice of geometrical conditions during the evaporation of the layers. Random irregular nonuniformities of the thickness of

ACC NR: AP5022864

the resonator average out because of the oblique incidence of the light and have a much smaller effect than assumed before. Inasmuch as the experiments reported in the literature at present date back some 15 years, it is concluded that new experimental studies of total-reflection filters, with an aim at checking the calculations in the article, are advisable and would yield valuable information on the structure of thin films, and may possibly lead to the construction of optical instruments of practical interest. TITLE: Scattering of conduction electrons in very thin films

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 50, no. 3, 1966, 709-716

TOPIC TAGS: thin film, conduction electron, electron scattering, metal film, phonon

ABSTRACT: Scattering of conduction electrons in very thin semimetallic films in which the de Broglie wavelength is comparable with the film thickness is calculated in the effective mass approximation. The probability for scattering of electrons on phonons, on electrons, and on geometrical defects of the film surface is computed. It is assumed that the mean-free-path of the electron is large compared with the film thickness and that reflection of electrons from the boundary is mainly of a specular nature. When the possible electron states are represented in momentum space, they are shown to be arranged in layers;

Card 1/2

L 22257-66

ACC NR: AP6010992

0

a certain value of quantized transverse energy corresponds to each given layer. Longitudinal scattering of electrons is related only to rotation of quasi-momentum of longitudinal electrons. Transverse scattering is accompanied by transition of the electron from one layer to another. It is found that owing to the conservation of longitudinal quasi-momentum, elastic transverse transitions can be induced only by phonons of finite energy. Therefore, at low temperatures (when these are absent), transverse electron-phonon scattering is associated only with spontaneous emission of phonons. If the latter is forbidden, as in the case of a normal metal, the scattering probability drops exponentially with the decreasing temperature. Transverse electron-electron scattering due to transitions between layers of different parity is forbidden in a film with identical conditions on both surfaces as a consequence of symmetry, and there is no electron-electron transverse scattering in the second layer. The probability of longitudinal electron-electron scattering increases proportionally to the cube of the longitudinal quasi-momentum. Owing to quantization of the transverse motion, the electron transverse diffusion reflection coefficient of the film surface is strongly suppressed as compared to the diffusion coefficient of a single surface.

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 36, no. 11, 1966, 2056-2063

TOPIC TAGS: electromagnetic wave, microwave resonance capacitor, reflecting barrier, resonance pairing, electromagnetic wave radiation, electromagnetic wave oscillation, electromagnetic wave phenomenon, magnetic resonance

ABSTRACT: A computation is made of the emission of an electromagnetic wave from a resonance capacitor. It was found that the intensity of the wave emitted from the surface of the resonator decreases exponentially with displacement along the resonator decreasing e times for length $\frac{l_0}{2}$. Computations are made for a resonance capacitor in which the thickness of a totally reflecting barrier varies with displacement along the resonator. Under the logarithmic law on variations in

Card 1/2

UDC: 538.565

ACC NR: AP6036037

barrier thickness, the resonance capacitor radiates an ideally flat monochromatic wave from the entire surface. Furthermore, the phenomenon is wholly reversible, i. e., by satisfying conditions for resonance, the incident flat monochromatic wave penetrates completely into the resonance capacitor. No reflected waves arise under these circumstances. The effect of resonance pairing of two flat dielectric resonators divided by a totally reflecting barrier is computed. The pairing effect which was observed earlier between the filaments of a light conductor (pipe guide), is in a state of resonant wave transfer between the resonators. A wave set in motion along one of the resonators for a length l_c passes completely into the second resonator, then transfers back, and so on, i. e., the amplitude of the waves in the resonators oscillates in space, forming a distinctive picture of spatial pulsations. The length along which pairing takes place is $l_c \ll l_0$.

TITLE: Radioisotopic level gage. Class 42, No. 173972

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 16, 1965, 91-92

TOPIC TAGS: radiation detector, radioisotope, radiation source, electric circuit

ABSTRACT: This Author Certificate presents a radioisotopic level gage with a mobile source, a receiver of ionizing radiation, and a follow-up system. To increase the range of measurement oscillation level, an open trolley system is included, along the direction of movement of the radiation receiver. The trolley system consists of two cables (or wires) and two current extractors forming a connection between the radiation detector and the following electric circuit: (see Figure 1).

 TITLE: Semi-conductor generators of operating current. (Polu-
 provodnikovye generatory operativnogo toka)
 PERIODICAL: "Elektricheskie Stantsii", (Power Stations), 1957,
 Vol. 28, No. 4, pp. 74 - 75 (U.S.S.R.)

ABSTRACT: Small steam turbine driven power stations with sets of
 2.5 - 6 MW may be operated without accumulator batteries if
 the current protection is operated from current transformers
 and remote protection of circuit breakers and automatic equip-
 ment is operated from voltage transformers. However, the
 operation of opening circuit breakers can also be effected by
 semi-conductor thermo-couples using waste heat of furnace
 gases in the smoke stack. This has the advantage over opera-
 tion on a short circuit does not affect the operating current
 which remains even if the main voltage is cut off.
 The semi-conductor research institute of the Academy of
 Sciences of the USSR has developed and passed over for manu-
 facture thermocouple generators with an output of 3 W for
 radio receivers and of 16 W for radio transmitters. The hot
 junctions are heated by kerosene burners and the cold
 junctions are air cooled. It would now be possible to build

TOGANDSON, V. E. O raskhodnaya voda na gidrologicheskuyu semyu v usloviyakh raznoy evapotranspiratsii [Minimum of the year mean hydrological seasons is the phase of European U.S.S.R.] Problemy Pishchikoy Geografii, 10(113-118), 1948, 5 tables, 8 refs. DUC—The author analyzes the seasonal distribution of runoff in various rivers of European Russia. Data are given on the average date of beginning of flood water and its duration; mean monthly distribution of runoff in percent of total annual runoff, mean percent runoff during spring and percent snow melt and runoff during spring. The hydrological characteristics of the various seasons are described. It is shown that they differ in the northern, central and southern parts of the U.S.S.R.; within those areas the runoff phases occur simultaneously. The hydrological seasons are not fixed; the date of beginning of spring flood is of fundamental importance in determining the time of the hydrological season. Authors : Iogansen, B. G., Prof.

Title : Lamarck and modern biology

Periodical : Priroda 44/6, 50 - 56, Jun 1955

Abstract : A biographical sketch is given of Jean Baptiste Lamarck (1744-1829), noted French botanist and zoologist. An analysis is made of his writings to show that he differed with the concept of a fixed creation, prevailing at his time, and advanced ideas that are in accord with modern views on evolution. Twelve Soviet references (1891-1951). Illustration.

Title : A Reply

Orig Pub : Uch. zap. Tomskogo un-ta, 1956, 27, 125-126

Abstract : The problems of origin of species were solved unsatisfactorily by previous theories, and only the Michurin course represents a creative development of Darwinism. Although T.D. Lysenko expressed some controversial theories, they are not the main ones in the new studies of origin of species. Under the direct influence of environments different seasonal, ecological and geographical forms appear. It is possible that both a speedy "transformation" of species occurs under changed conditions over several generations, as well as a prolonged existence of species in an unchanged condition while the former conditions of existence are preserved. A species determination is given

which includes 4 criteria: a morphological one (accounting for changes and hiatuses), a physiological, a geographical, and an ecological one (accounting for the difference of intra-species relations). The difficulties of species demarcation by these criteria prove the presence in nature of different paths of origin of species. The author explains the intermittent origin of species not as a sudden regeneration, but as a qualitative change. The origin of species in animals and plants manifests differences which lead to divergence in concepts of species by zoologists and botanists. Acknowledging the existence of divergence, the author does not consider it a consequence of intraspecies struggle. Numerous examples are cited of the differences between intraspecies and interspecies relations. Overpopulation is viewed as a temporary and relative phenomenon, which can only hasten the process of origin of species. In this reply the speaker takes issue with L.V. Shumilova and disputes the contradictions and errors in Darwin's studies.

SOV/26-59-3-9/47

AUTHOR: Ioganzon, B.G., Professor, and Fetkevich, A.N.,
Candidate of Biological Sciences

TITLE: The Protection of Fishes of West Siberia

PERIODICAL: Priroda, 1959, Nr 3, pp 49 - 54 (USSR)

ABSTRACT: West Siberia, with its huge Ob River basin and adjoining big systems of lakes, like the Baraba, Kulunda and North Kazakhstan, represents a most important fishery district. The local reservoirs are inhabited by over 50 species and subspecies of fishes, including such valuable ones as the Siberian sturgeon, ~~gymal~~, a salmon species etc. Fishing in West Siberia yields several tens of thousands of tons yearly, and exceeded 70,000 tons in some years. The quantities would be larger if the protection of water from pollution and melioration works were better organized. Until recently the restocking of fish in the reservoirs of Western Siberia was given no attention. This explains the fact that in the

Card 1/4

SOV/26-59-3-9/47

The Protection of Fishes of West Siberia

Ob' basin, where for many years the Ust'-Kamenogorsk and the Novosibirsk GES have been operating, thereby greatly disturbing the spawning conditions of the sturgeon and white salmon, not a single fish-breeding, spawning and fish raising farm has been erected. In some instances extraordinary measures are required to stop the pollution of reservoirs. The author gives particulars on the disappearance of fishes caused by the Omskiy nefteperegonnyy zavod (Omsk Petroleum Refinery) which polluted the waters of the Irtysh and Ob' Rivers for hundreds of kilometers. In recent years, some large plants have begun to build special cleaning installations, but numerous enterprises of the Altay and Kuzbass, and of the cities of Omsk, Barnaul, Novosibirsk, Tomsk, etc. still discharge their waste directly into natural waters. The author points out the principal measures to be adopted for the cleaning of

Card 2/4

SOV/26-59-3-9/47

The Protection of Fishes of West Siberia

waters and the protection of fishes when erecting hydroelectric power stations. He mentions in this connection the Bukhtarminskaya and Shul'binskaya (Bukhtarma and Shul'ba) GES and those intended to be built at the Irtysh and Ob' Rivers. The Novosibirsk Sovnarkhoz has decided to erect a sturgeon and white salmon fish-breeding plant at the dam of the Novosibirsk GES. The Tomsk Sovnarkhoz intends to build a plant for breeding Coregonus maksun and Coregonus pelea in the Shegarka district. The author deals with the prohibited methods of fishing, the unlawful catching of young fishes and the winter fishing in the bays, resulting in the destruction of over 90 % of young fishes according to observations made by B.K. Moskalenko. He calls attention to the detrimental influence of natural factors (draining, freezing, salting, underfeeding, parasites, etc.). In this connection he mentions
